Kernel Embedding for Particle Gibbs-Based Optimal Control

L. Hochschwarzer

Intermediate Report Master's Thesis

Supervisor: R. Lefringhausen

Chair of Information-oriented Control

Technical University of Munich

Motivation

[Xiloyannis, Chiaradia, Frisoli and Masia 2019]

Challenges:

- Unknown Dynamic
- Latent States
- Safety

Problem Statement - System

Given: Dataset $\mathbb{D} = \{ \boldsymbol{u}_t, \boldsymbol{y}_t \}_{t=-T:-1}$ from unknown system

$$egin{aligned} oldsymbol{x}_{t+1} &= oldsymbol{f}\left(oldsymbol{x}_{t}, oldsymbol{u}_{t}
ight) + oldsymbol{v}_{t}, & oldsymbol{v}_{t} \sim oldsymbol{\mathcal{V}}, \ oldsymbol{y}_{t} &= oldsymbol{g}\left(oldsymbol{x}_{t}, oldsymbol{u}_{t}
ight) + oldsymbol{w}_{t}, & oldsymbol{w}_{t} \sim oldsymbol{\mathcal{V}}, \end{aligned}$$

Assumptions

■ Known system structure

$$egin{aligned} oldsymbol{x}_{t+1} &= oldsymbol{f}_{oldsymbol{ heta}}\left(oldsymbol{x}_{t}, oldsymbol{u}_{t}
ight) + oldsymbol{v}_{t}, & oldsymbol{v}_{t} \sim oldsymbol{\mathcal{V}}_{oldsymbol{ heta}}, \ oldsymbol{y}_{t} &= oldsymbol{g}_{oldsymbol{ heta}}\left(oldsymbol{x}_{t}, oldsymbol{u}_{t}
ight) + oldsymbol{v}_{t}, & oldsymbol{w}_{t} \sim oldsymbol{\mathcal{V}}_{oldsymbol{ heta}}, \end{aligned}$$

■ Known priors $p(\theta)$ and $p(x_{-T})$

Problem Statement - Optimal Control Problem

Goal: Solve optimal control problem (OCP)

Stochastic OCP

$$\min_{oldsymbol{u}_{0:H}} J_H(oldsymbol{u}_{0:H}, oldsymbol{x}_{0:H}, oldsymbol{y}_{0:H})$$

subject to:

$$P[h_i(\boldsymbol{u}_{0:H}, \boldsymbol{x}_{0:H}, \boldsymbol{y}_{0:H}) \le 0] \ge 1 - \alpha, \ \forall i = 1, ..., n_c$$

Problem: Underlying data distribution P is unknown

Related Works

Particle Gibbs Based Optimal Control [Lefringhausen, Srithasan, Lederer and Hirche 2024]

 \Rightarrow Risk factor α has to be calculated retroactively and cannot be controlled directly

Alternative Approaches:

- Wasserstein Ambiguity [Hota, Cherukuri and Lygeros 2019]
- Kernel Embeddings [Thorpe, Lew, Oishi and Zhu 2022]

[Nemmour, Kremer, Schoelkopf and Zhu 2022]

Particle Gibbs Scenarios

Particle Gibbs gives us the scenarios $\boldsymbol{\delta}^{[1:N]} = \{ m{\theta}, m{x}_0, m{v}_{0:H}, m{w}_{0:H} \}^{[1:N]}$ that characterize the system

Goal: Reformulate chance-constraint problem with scenarios $oldsymbol{\delta}^{[1:N]}$

Chance Constraints

$$P[h_i(\boldsymbol{u}_{0:H}, \boldsymbol{x}_{0:H}, \boldsymbol{y}_{0:H}) \le 0] \ge 1 - \alpha, \ \forall i = 1, ..., n_c$$

11

Scenario Approach (used in [Lefringhausen+ 2024])

$$h_i(\boldsymbol{u}_{0:H}, \boldsymbol{x}_{0:H}^{[n]}, \boldsymbol{y}_{0:H}^{[n]}) \leq 0, \ \forall n = 1, ..., N, \ \forall i = 1, ..., n_c$$

 \Rightarrow Risk factor α not considered in optimization

Maximum Mean Discrepancy (MMD) ambiguity sets

Goal: Reformulate chance-constraint problem with scenarios $oldsymbol{\delta}^{[1:N]}$

Expanded Chance-Constraints

$$\inf_{\tilde{P}\in\mathcal{P}}\tilde{P}\left[h_i(\boldsymbol{u}_{0:H},\boldsymbol{x}_{0:H},\boldsymbol{y}_{0:H})\leq 0\right]\geq 1-\alpha.$$

 ${\mathcal P}$ is constructed with the samples ${m \delta}^{[1:N]}$ as

MMD ambiguity set

Introduction

$$\mathcal{P} = \left\{ \tilde{P} : \mathsf{MMD}(\tilde{P}, P_N) \leq \varepsilon \right\}.$$

With large enough $N \Rightarrow P$ is an element of \mathcal{P}

Constraint Reformulation

Goal: Reformulate chance-constraint problem with scenarios $\boldsymbol{\delta}^{[1:N]}$

Feasible Region of chance constraint

$$Z_i := \left\{ oldsymbol{u}_{0:H} \in \mathcal{U}^{H+1} : \inf_{ ilde{P} \in \mathcal{P}} ilde{P} \left[ilde{h}_i(oldsymbol{u}_{0:H}, oldsymbol{\delta}) \leq 0
ight] \geq 1 - lpha
ight\}$$

 \Downarrow

Reformulated Feasible Region [Nemmour+ 2022]

$$Z_{i} \coloneqq \left\{ \boldsymbol{u}_{0:H} \in \mathcal{U}^{H+1} : g_{0} + \frac{1}{N} \sum_{n=1}^{N} (\boldsymbol{K}\boldsymbol{\gamma})_{n} + \varepsilon \sqrt{\boldsymbol{\gamma}^{\mathsf{T}} \boldsymbol{K} \boldsymbol{\gamma}} \leq t\alpha \\ [\tilde{h}_{i}(\boldsymbol{u}_{0:H}, \boldsymbol{\delta}^{[n]}) + t]_{+} \leq g_{0} + (\boldsymbol{K}\boldsymbol{\gamma})_{n}, \ n = 0, ..., N \right\}$$

$$g_{0} \in \mathbb{R}, \boldsymbol{\gamma} \in \mathbb{R}^{N}, t \in \mathbb{R}$$

Problem Formulation

Goal: Reformulate chance-constraint problem with scenarios $oldsymbol{\delta}^{[1:N]}$

$$\begin{aligned} & \min_{\boldsymbol{u}_{0:H}, \{g_0, \boldsymbol{\gamma}, t\}^{[1:n_c]}} J_H(\boldsymbol{u}_{0:H}, \boldsymbol{x}_{0:H}^{[n]}, \boldsymbol{y}_{0:H}^{[n]}) \\ \text{subject to: } \forall n \in \mathbb{N}_{\leq N}, \ \forall t \in \mathbb{N}_{\leq H}^{0}, \ \forall i \in \mathbb{N}_{\leq n_c} \\ & \boldsymbol{x}_{t+1}^{[n]} = \boldsymbol{f}_{\boldsymbol{\theta}^{[n]}} \left(\boldsymbol{x}_t^{[n]}, \boldsymbol{u}_t\right) + \boldsymbol{v}_t^{[n]} \\ & \boldsymbol{y}_t^{[n]} = \boldsymbol{g}_{\boldsymbol{\theta}^{[n]}} \left(\boldsymbol{x}_t^{[n]}, \boldsymbol{u}_t\right) + \boldsymbol{w}_t^{[n]} \end{aligned} \end{aligned} \end{aligned} \text{ Dynamic Constraints } \\ & \boldsymbol{u}_{0:H} \in Z_i(g_0^{[i]}, \boldsymbol{\gamma}^{[i]}, t^{[i]}) \end{aligned} \right\} \text{ Reformulated Chance Constraints}$$

Simulation Setup

■ Unknown system:

$$f(\boldsymbol{x}, u) = \begin{bmatrix} 0.8x_1 - 0.5x_2 \\ 0.4x_1 + 0.5x_2 + u \end{bmatrix}$$

$$\boldsymbol{x} \in \mathcal{N} \left(0.00 - \begin{bmatrix} 0.03 & -0.004 \end{bmatrix} \right)$$

$$oldsymbol{v}_t \sim \mathcal{N}\left(oldsymbol{0}, oldsymbol{Q} = egin{bmatrix} 0.03 & -0.004 \\ -0.004 & 0.01 \end{bmatrix}
ight).$$

■ Known system structure:
$$f(x,u) = A[x_1,x_2,u]^{\mathsf{T}} + v_t, \ v_t \sim \mathcal{N}(\mathbf{0}, Q)$$

■ Priors:

$$oldsymbol{Q} \sim \mathcal{IW}(100oldsymbol{I}_2, 10) \ oldsymbol{A} \sim \mathcal{MN}(oldsymbol{0}, oldsymbol{Q}, 10oldsymbol{I}_2)$$

[Andrieu+ 2017]

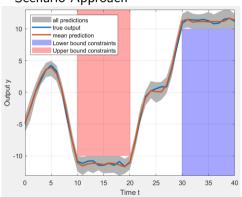

$$\boldsymbol{x}_{\text{-}T} \sim \mathcal{N}([2,2]^{\mathsf{T}}, \boldsymbol{I}_2)$$

- Known measurement model $q(\boldsymbol{x}, u) = x_1, w_t \sim \mathcal{N}(0, 0.1)$
- Cost function $J_H = \sum_{t=0}^H u_t^2$
- Input constraints |u| < 10
- Gaussian kernels with bandwidth σ set via the median heuristic [Garreau+ 2018]
- Ambiguity set radius ε set via bootstrap construction [Nemmour+ 2022].

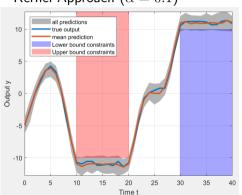

Optimal Control with Constrained Outputs

Number of scenarios used for optimization: N=200

Scenario Approach

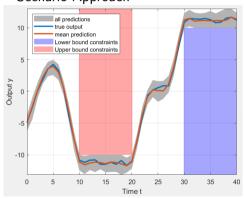

Kernel Approach ($\alpha = 0.1$)

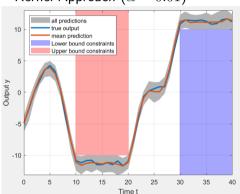

Optimal Control with Constrained Outputs

Number of scenarios used for optimization: N=200

Scenario Approach

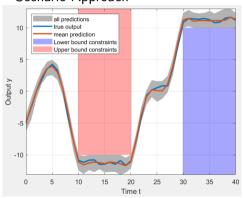

Kernel Approach ($\alpha = 0.01$)

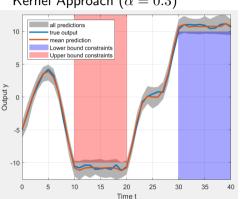

Optimal Control with Constrained Outputs

Number of scenarios used for optimization: N=200

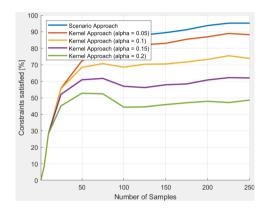

Scenario Approach

Kernel Approach ($\alpha = 0.3$)

Successrate of Solution

N=2000: Number of Scenarios used to test $u_{0:H}$

Successrate does **not** converge to $(1-\alpha)$ Potential explaination:

Guarantee constraint is applied to each output constraint seperately

Conclusion

Summary: Kernel Embeddings allow for ...

- Solving of chance-constrained OCPs
- Controlling of risk factor α

Future Plans:

- Use Kernel Embeddings on non-linear systems
- Parameter tuning of σ
- Alternative approach of reformulating chance constraints

Timeline

Scenario Generation

Goal: Generate scenarios $oldsymbol{\delta}^{[1:N]}$ using the observations $\mathbb D$

Algorithm: Scenario Generation

For n = 1, ..., N:

- 1. Sample $\{m{\theta}, m{x}_{-T:-1}\}^{[n]}$ from $p(m{\theta}, m{x}_{-T:-1} \mid \mathbb{D})$ using PMCMC [Lefringhausen+ 2024].

 2. Sample $m{v}_t^{[n]}$ from $m{\mathcal{V}}_{m{\theta}^{[n]}}$ and $m{w}_t^{[n]}$ from $m{\mathcal{W}}_{m{\theta}^{[n]}}$ for t=-1,...,H3. Set $m{x}_0^{[n]} = m{f}_{m{\theta}^{[n]}} \left(m{x}_{-1}^{[n]}, m{u}_{-1} \right) + m{v}_{-1}^{[n]}$ Output: Scenarios $m{\delta}^{[1:N]} = \{m{\theta}, m{x}_0, m{v}_{0:H}, m{w}_{0:H}\}^{[1:N]}$

Bootstrap Construction

Algorithm: Bootstrap MMD ambiguity set

- 1. $K \leftarrow kernel(\delta, \delta)$
- 2. For m = 1, ..., B
- 3. $I \leftarrow N$ numbers from $\{1, \dots N\}$ with replacement
- 4. $K_x \leftarrow \sum_{i,j=1}^{N} K_{ij}, K_y \leftarrow \sum_{i,j\in I} K_{ij}, K_{xy} \leftarrow \sum_{j\in I} \sum_{i=1}^{N} K_{ij}$ 5. $\mathsf{MMD}[m] \leftarrow \frac{1}{N^2} (K_x + K_y 2K_{xy})$
- 6. End For
- 7. $\mathsf{MMD} \leftarrow \mathsf{sort}(\mathsf{MMD})$
- 8. $\varepsilon \leftarrow \mathsf{MMD}[\mathit{ceil}(B\beta)]$

Output: Gram matrix K, Radius of MMD ambiguity set ε

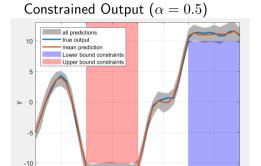

$$B = 1000, \beta = 0.95$$

Max Constraint

Chance Constraint

$$P\left[\max(m{h}(m{u}_{0:H}, m{x}_{0:H}, m{y}_{0:H})) \le 0\right] \ge 1 - \alpha$$
